

HPLC Analysis

Freely distributed software for Igor-Pro for the analysis of chromatography recordings. It automatically identifies peaks and calculates their concentration.

We created this program (macros for Igor Pro) for the analysis of the acquired chromatograms from our HPLC and UHPLC systems. It identifies the peak based on the retention times and calculates the concentration of the species. We use this program intensively during our laboratory routines for the quantification of catecholamines, serotonin and their metabolites.

This program can be freely shareware upon request.
